

Compose your own personal skin protection program

Vendor offers a range of standard number of products that are usable in most industrial environments and situations. If additional advice is required, your contact person will be happy to assist.*

Protection: before and during work

Skin protection creams may be categorised as follows:

- For water-soluble pollution
- For water-insoluble pollution
- A special application such as UV, glove wearers or dual application.

The cream should leave a thin layer to protect the skin from external substances, but it should not affect the work.*

Cleaning: before, during and after the work

It is important that the cleansing product is as strong as necessary but at the same time as mild as possible for the skin. A wrong cleaning product is in fact one of the main causes of skin diseases.

Solutions provide cleaners for lightly to strongly adhesive pollution and should comply with the following*:

- Adapted to the pollution
- Adapted to the degree of pollution
- Less stressful for the skin than the pollution itself
- pH value equal to the skin

Care: after the work

After completion of the work, when the skin has been cleansed, it is important to use skin care. Creams are available from lightly nurturing to intensively nourishing creams for particularly dry skin and aim to:

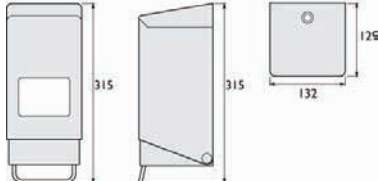

- Regenerate the skin
- Repair lipids and moisture as a result of work-related loss thereof
- Prevent dehydration
- Combat loss of elasticity due to ageing

In addition, they are easy to apply and are absorbed quickly. They contain the proper active ingredients and have been adapted to the specific skin types and conditions.

* Please ask your contact person about the options and conditions.
